vice versa

http://wiki.openvz.org/Using_NAT_for_VE_with_private_IPs#How_to_provide_access_for_VE_to_Internet

```
# iptables -t nat -A POSTROUTING -s src_net -o eth0 -j SNAT --to ip_address
```

where src_net is a range of IP addresses of VEs to be translated by SNAT, and ip_address is the external IP address of your Hardware Node. Multiple rules are allowed, for example, in case you wish to specify several ranges of IP addresses. If you are using a number of physical network interfaces on the Node, you may need to specify a different interface for outgoing connections, e.g. -o eth2.
