Hi Tim,

I'm sorry but information in CentOS bug is not enough for investigation. I need to know exact kernel version (currently I do not understand is it x86 or x86_64?) and see all kernel messages.

Could you please boot our latest kernel, collect all kernel messages by using remote console and send it to us?

Because we have disk-related failures, the error messages are visible in dmesg only and cannot be saved on the local disk. Therefore to collect error log messages it's required to configure remote console:

http://wiki.openvz.org/Remote_console_setup

Then it would be great to check latest vendor kernels (2.6.9-63 for RHEL4 and 2.6.18-53 for RHEL5). If you still have some troubles with these kernels -- I can help you to collect all required information and send bugreport to Red Hat and 3Ware.

Thank you,
Vasily Averin
