---

I've been comparing two of my servers which have very different loads. I migrated all VPS's from both servers and one still has a load of 1.0 and the other is 0. The only difference I see is that one server is running a process called 'vzwdog' which is taking up a lot of CPU time.

Both servers have VZWDOG="no" in the vz.conf. What is this process and why is it running?
