Sure.

1. I get the source downloading the 2.6.18 tarball from the main kernel site. Then I download the ovz patch (as I've always done and as it works on the x86 arch) and apply it. It applies without any problem. Then I get the old 2.6.18 .config file, I type a "make oldconfig" and put some missing variables (like the grsecurity support).

After this I just give a "make-kpkg --initrd kernel-image kernel-headers" and, after some compiling, it stops with that error.

Performing a normale "make" gives the same result.

No other patches have been applied.

Thank you!
