Sorry for Replying on this.

Since its old and Its a Hijack Question.

But I just cant put my finger on this.

Well I want to mount /vz/portage to the running system

Do I have to mount to the root or the private?

I tried both.. And sometimes It works.. And sometimes it doesnt.

Well I cross-mount the system like crazy.. (I first mount /var/lib/vz/private (and root) to /vz/private (and root), then I want to mount Portage in that again. from /vz/portage to /vz/./usr/portage) but well sometimes it works and sometimes it doesnt.

How to fix? What do I have to mount? And were to?

I just want to have one Portage tree on my box -.-' should that be this hard..
