Greetings,

I've got a debian guest image running, seems to run just fine, however I can't seem to get networking working, I created both venet0 and venet0:0 and it sees them just fine when I do a ifconfig, however; the setting the gateway as 191.255.255.1 it doesn't like, could someone provide an interface file (example file) and what needs to be done in terms of routing? Thanks

-doug
