This patchset provides the changes to make the ipv6 protocol to handle multiple network namespaces.

There is a pre-requisite which is already merged in net-2.6.25, it is the separate workq for the network namespace cleanup. It will disappear when Denis will rebase the patchset to the latest net-2.6.25.

The sysctl per net is not yet implemented (coming soon), the patchset adds a flag to activate the network namespace only if sysctl is disabled. It will be reverted as soon as we handle sysctl.

This subset makes per namespace:

- * inet6_addr
- * ip6_fib
- * fib6_rules
- * rt6_stats
- * rt6_info
- * route6
- * addrconf
- * ndisc

The minimum set of functionalities we have with this patchset allows to setup the routes, ipv6 addresses per namespaces and check the proc files are isolated.
