1. you need to install SRC RPM (http://openvz.org/download/kernel/)

2. somewhere in /usr/src (depending on host OS you use. e.g. redhat usually keeps them in /usr/src/redhat, SUSE in /usr/src/packages)
you will have directory SPECS and kernel-ovz.spec file in it.

3. in kernel-ovz.spec there is list of patches to apply.
For example, if you say the patch I proposed as /usr/src/.../SOURCES/isofs.patch, then in kernel-ovz.spec you need to add line (after the last 'PatchXXXX: ...' there):

Patch9999: isofs.patch

and line (right after the last '%patch ...':

%patch 9999 -p1

4. after that you simply need to build new RPMs with:
rpmbuild -ba --target=i686 kernel-ovz.spec

5. build RPMs will be saved in /usr/src/.../RPMS/i686/
