
Subject: /proc/user_beancounters and vzlist giving different outputs

well I created a script for checking my ram usage.

Using the output of /proc/user_beancounters, the total bytes of ram being used are: 20931303
with `vzlist -o` with the same fields that I use with the beancounters, the sum is 20847588.

I've checked for differences, and at least `kmemsize` show different values in `user_beancounters`
and in `vzlist -o kmemsize`...is this normal? Which one is the correct one?

Thank you
