Subject: /proc/user_beancounters and vzlist giving different outputs
Posted by blunt on Fri, 07 Dec 2007 21:40:46 GMT

well I created a script for checking my ram usage.

Using the output of /proc/user_beacncounters, the total bytes of ram being used are: 20931303 with vzlist -o with the same fields that I use with the beancounters, the sum is 20847588.

I've checked for differences, and at least kmemsize show different values in user_beancounters and in vzlist -o kmemsize...is this normal? Which one is the correct one?

Thank you
