---

well I created a script for checking my ram usage.

Using the output of /proc/user\_beancounters, the total bytes of ram being used are: 20931303  
with vzlist -o with the same fields that I use with the beancounters, the sum is 20847588.

I've checked for differences, and at least kmemsize show different values in user\_beancounters  
and in vzlist -o kmemsize...is this normal? Which one is the correct one?

Thank you
