The only problem with official ubuntu 7.10 is it comes with upstart, ubuntu replacement for sysvinit. Upstart in VE requires a little change from vzctl to work properly. This will be released soon in vzctl-3.0.20.

For now, you have the following options:

1. Recompile vzctl from git.
 2. Recompile vzctl with a patch from <http://bugzilla.openvz.org/662>
 3. Use "contributed" ubuntu-7.10 template which doesn't have upstart.
 4. Replace upstart with sysvinit in your VE/template.
