I have problem with LVM on CentOS 4.3 x86 with openvz 2.6.8-022stab072-smp

I can't create logical volume in lvm (I can create pv, vg)

I get error message (Clipboard.jpg)

In original distribution kernel everything works fine, I can create, format and mount lv.

I'm using HighPoint 2220 raid card, driver is loaded, system can see the drive (raid5 array). I am able to create, format and mount normal partitions on both kernels.

What is the problem?

Do I have to change something in lvm config?
