Hi

Yes i realise that, I have been adding IP addresses using vzctl, but if i restart the network (after adding some extra routes) from within the VE then I get these errors.

I have fixed the issue by commeting out the line in /etc/vz/dists/scripts/redhat-add_ip.sh:

```
#put_param $NETFILE GATEWAY ${FAKEGATEWAY}
```

This was what was putting the fake gateway in each time.

Now I don't get any errors.
