Subject: Re: Truecrypt in OpenVZ Posted by RobinVossen on Mon, 17 Dec 2007 13:33:33 GMT View Forum Message <> Reply to Message

Thanks ^^ I tried dm-crypt since I cant really use the Fuse one But ok, Installed all. Now I need to use it. I did mount proc in my OpenVZ system (since it needs proc) and now I need to use /dev of the original system aswell. is it save to mount that? And how to mount that? Since I first have to use dm-setup to create a device so I did that and I got this:

1 / # dmsetup create sxb /dev/mapper/control: open failed: Permission denied Failure to communicate with kernel device-mapper driver. Command failed

Im not sure I understand it but if I do I need:

dmsetup create <name>

0 <sector count> crypt <sector format> <key> <IV offset> <real device> <sector offset> cryptsetup [<OPTIONS>] create <name> [<device>] cryptsetup [<OPTIONS>] status <name> [<device>]

I hope I am right here? I need to mount it only when the user wants to. So not when the system boots.

Cheers, Robin
