Hello,
After incorrect hwnode reboot, one of VEs didn't go up:
/vz/log/vzctl.log: vzquota init failed [1]

Quota was recalculated by the following command:
/usr/sbin/vzquota init 100 -b 20485860 -B 20485860 -i 200100 -I 220100 -p /vz/private/100 -e 0 -n
0 -s 1 -u 200

I've strace'd this command, and found that it failed while working on some file.
I went to those directory, where file was located, and found:
#ls -l
?---------   ? ?   ?   ?   ? filename

After removing it, quota was successfully recalculated, and VE started up.

Maybe do you know, what does it mean when i see only question signs in ls -l ?
Also is there some way to configure vzquota to tell filename in error output (if it failed due to
broken file)? It's not very nice to strace it each time
