it's really hard to ask your question, since technically you provided too little details.

what do you run and what do you measure? any exact commands?
do you run your command in VE or remotely or how?
and so on.

from what I can guess, you run the same app in 8 VEs,
all are loaded, so when you run 8 VEs instead of one, you should get 30*8 = 240 secs, but get 276.
is it the case?
