---

6 hours later, and a nap.....

I grabbed the ubuntu-6.06-i386-minimal template from contrib, created a whole new VE, and after launching:

- didn't have IPv6 configured on venet0
- venet0:0 wasn't created with the IPv4 IP either

So I ran: /etc/init.d/network restart

got the following output:

```
* Reconfiguring network interfaces...
```

```
SIOCSIFADDR: File exists
```

```
Failed to bring up venet0.
```

```
[ ok ]
```

And despite errors:

- venet0 had the IPv6 address
- venet0:0 was created with the IPv4 address
- I have working IPv4/6 connectivity

So I tried the ubuntu-7.10-i386-minimal template also out of contrib, but it has the same behavior as the other 7.10 template I've been trying.
