I went through the wiki steps for installing under a Debian environment and then rolling your own Gutsy template (which are awesome resources, thanks to those that wrote them up):

http://wiki.openvz.org/Installation_on_Debian
http://wiki.openvz.org/Ubuntu_Gutsy_template_creation

After creating a brand new VE based on an installation of Ubuntu-7.10-server-i386, still no IPv6 love under the VE.

Of course on that brand new 7.10 server I installed, IPv6 works without issue.

So I suppose I could try 7.0.4-server-i386 since I just found the cd in my stack, and see if its an issue with the 7.x branch seeing as Debian-4.0 and Ubuntu-6.0.6 both supported IPv6 as a VE.

{EDIT}

No luck with Ubuntu-7.0.4-server-i386 (feisty) either. And I had even tried /etc/init.d/network restart in all my attempts
