Hello,

I'm trying to install cPanel on 2 different VPSes, but it isn't going through as it should be. I tried the installation on dedi and it was completed without any glitches(yes, a dedi is easier to manage than a VPS)

I'm mainly geting this error:

```
[root@server home]# sh latest
```

```
Creating directory installd
```

```
Verifying archive integrity...latest: fork: Cannot allocate memory
```

```
Error in checksums: is different from 3288460579
```

And the number 3288460579 is sometimes different, but everytime I can see only memory limit errors. How do I fix\ them, as these are on every vps?
