curx wrote on Sat, 22 December 2007 01:58Hi,

i found the error :

on ifup with an IPv6 address, invoke by /etc/init.d/networking, the command start a "modprobe -Q ipv6", fails in VE so with a "fake-modprobe-script"

```
# ln -s /bin/true /sbin/modprobe
```

the error is gone and IPv6 is ready to connect

Awesome, it is working now. I just had to stop/start the entire VE for it to pick up the IPv6 address.

Cheers!
