I've recently put together this patch to convert a vanilla centos-4 metadata into one for centos-5. Template works flawlessly for me.

Instructions to apply the patch:

1) wget

<http://download.openvz.org/template/metadata/centos-4/src/vztmpl-centos-4.src.tar.bz2>

2) tar xvjf vztmpl-centos-4.src.tar.bz2

3) cd centos-4

4) patch -p1 < /path/to/attached/centos-5-metadata.diff

5) yum install createrepo

6) make clean

7) make rpms

If your arch is i386, the metadata rpm should now be located in:

`/usr/src/redhat/RPMS/i386/vztmpl-centos-5-2.0-2.i386.rpm`

Notes:

- "kernel = 2.6.18" is needed to fix the "Error: initscripts conflicts with kernel < 2.6.12"

- udevd must be disabled when the vps starts up

I'd very much be interested in seeing this become an official metadata template on openvz.org. I'd like to get centos-5 out of the user contrib area.

-Chris
