Hello Daniel,

could you please tell which exact OpenVZ kernel did you try?
And in order to understand why the system doesn't boot we need some info the system provides while booting:
1) what does it print on the local console when it fails to boot?
2) is there any errors in /var/log/messages?

One more point: 2.6.22 branch is a development branch at the moment - it is not stable enough yet. So if you need the system to be stable - you'd better use stable RHEL5-based branch (2.6.18).
