Hi,

Now I clearly understand how I communicate in English
In truth, I am very vaguely understood what is your problem.
Let's I describe the problem as far I understand it and you correct if it will be mistakes here.

1. You have got the sources of htop.
2. Then you compile it like a common soft.
3. When you type "$htop" you receive the message that the command not found.
4. Then you install htop from rpm and everything is OK?

If so then:
a) Linux searches executable files path with the PATH environment variable.
b) You can see it value by "echo $PATH" command.
c) So if your executable file is not in the directories which are in the PATH variable you must use the full path of your executable.
d) Or you can add directory to your PATH variable
PATH=$PATH:YOUR_DIR
export PATH
YOUR_DIR - is the path of your directory.

Thank You!

//--- ----------//

```
PATH=$PATH:YOUR_DIR
export PATH
```
