Subject: error "failed to load module vzmon"

Hi All,

I've installed openvz, but when I try /sbin/service vz start, I get the error message "failed to load module vzmon".

I have SUSE linux Enterprise server 10, and doing the installation I had 3 issues:

First, durign the installation of the kernel that there is for SUSE, I reeboted the machine in this kernel before doing the changed in the files /etc/sysctl.conf, /etc/sysconfig/selinux and /etc/modprobe.conf. I know, a little bit stupid...

Second, in my linux distro there isn't a /etc/sysconfig/selinux file. What do I have to do, ignore the parameter SELINUX=disabled or create this file ??

Third, in my linux distro when I open the file /etc/modprobe.conf I found quoted lines that say that I have to do the modifications in the file /etc/modprobe.conf.local. Is that correct, or do I have to ingore it ?

Thanks in advance for the help !!
