Okay, we did some digging and found the bug in the latest version of vzctl scripts

in /usr/lib/vzctl/scripts/vps-functions on roughly line 126 (we did some debugging so we may have added/removed a few lines) there is:

```
dev="$({IP_CMD} route get "$1" |sed -ne '/ via /! s/^. * dev \([^ ]+\) \+src \+.*$/1/p;Q')
```

Unfortunately that doesn't parse properly when the argument \$1 is outside of the HN main ip range

(HN = Centos 4.6)

Downgrading to the previous version of vzctl solved it.
