If you want old (vzctl <= 3.0.18) behavior) which uses all interfaces, set NEIGHBOUR_DEVS=all in /etc/vz/vz.conf

Here is the description of this option, from vz.conf(8) man page:

Quote:NEIGHBOUR_DEVS[="detect"]

Controls on which interfaces to add/remove ARP records for a VE IP, also which interfaces to use to query/announce ARP. If this is set to detect, the right network interface (the one which is in the same subnet as a VE IP) will be chosen automatically. Any other value restores old (as of vzctl 3.0.19 or older) behavior, when all the possible interfaces were used.
