yettyn wrote on Tue, 08 January 2008 11:25I had this issue as well after creating my own ve-vps.conf-sample with vzsplit, replacing ve-vps.basic.conf-sample. It turned out vz set all to low and wrong values for quota and inodes, so in some cases I couldn't even create a VE as just the template caused the quota hardlimit to trigger

I think you can test this simple by setting DISK_QUOTA=no, if it works then you have found your problem

/Joakim
Correcting myself as this has started again, same pattern but I get err=-17 and now nothing seem to help, even if I switch off disk quota and give plenty of resourses... still can run max 1 VE
