I will try to get the log by the serial port, as it doesn't record anything in the /var/log/messages.

The system boots well with the newer CentOS/RedHat kernel (2.6.18-53.1.4), is there any plan to have a OpenVZ kernel based on that version? Is it different from the current OpenVZ kernel 2.6.18-53.el5.028stab051.1?

And what are the differences between the "OpenVZ RHEL5 kernel" versions (all based on the 2.6.18 kernel) and the "OpenVZ 2.6.18" kernel.

The kernel that hangs is the following:

ovzkernel-2.6.18-53.el5.028stab051.1.x86_64.rpm

Do you recommend trying with this instead?

kernel-smp-2.6.18-ovz028stab051.1.x86_64.rpm

Thanks!

Fernando
