This should be no problem as the raid1 is build into the openvz kernel not as a module, so it cannot find the raid1 module and have this warning.

Software RAID-1 should be no problem to use as we're using exactly the same openvz kernel in our production openvz server and booting with Linux Software RAID-1 on /. However we run it under Fedora Core 4 (should be not much difference?)

Maybe you can check the config of the grub.conf?
