Gents,

my question is.

What is better mounting an NFS share into each VE

or

mounting it on the host and bind it into the root after starting the VE?

Better means here where will the servers scale to more IO performance. I don't know where the buffering happens always on the host or in the VE when mountig inside the VE?

I think mounting inside VE has more sex but when the mount --bind gives more performnce or saves RAM i will prefer that.

Any idea?

with best regards
