Hi Peter,

> What definition of bandwidth does it use? Does it for example account
> for seek latency?

The bandwidth in dm-band is determined by the proportion of the processing time of each device's tokens(I/Os) to the processing time of all device's tokens(I/Os).

The processing time of one token(I/O) is determined by one I/O cycle include seek latency, interrupt latency, etc...

Thanks,

Ryo Tsuruta <ryov@valinux.co.jp>
