As I already said, these are fixed in -mm tree with the pid-namespaces-vs-locks-interaction.patch patch.

What really bothers me in this case is that in the "output" file you attached I see

<<test output>>>

```
80polaya
          0 INFO: Test all the facilities at a particular level.
80polaya
          0 INFO: Facilities available are: LOG KERN, LOG USER, LOG MAIL
syslog08 0 INFO: LOG_DAEMON, LOG_AUTH, LOG_LPR.
syslog08
         0 INFO: Don't know how to send kernel messages from syslog()
syslog08
          0 INFO: o Create seperate entries in config file for each facility.
syslog08
          0 INFO: o Send the message and grep for the entry in log file.
          0 INFO: syslog: Testing all the facilities
syslog08
syslog08
          0 INFO: Doing facility: user...
syslog08
         0 INFO: Restart /etc/init.d/syslog
syslog08
         0 INFO : Facility user passed
syslog08 0 INFO: Doing facility: mail...
syslog08 0 INFO: Restart /etc/init.d/syslog
syslog08 0 INFO: Facility mail failed
syslog08 0 INFO: Doing facility: daemon...
syslog08 0 INFO : Restart /etc/init.d/syslog
syslog08 0 INFO: Facility daemon passed
syslog08 0 INFO: Doing facility: auth...
syslog08 0 INFO : Restart /etc/init.d/syslog
syslog08 0 INFO: Facility auth passed
syslog08 0 INFO: Doing facility: lpr...
syslog08 0 INFO: Restart /etc/init.d/syslog
          0 INFO: Facility lpr passed
syslog08
         1 PASS: some facilities failed to work
syslog08
syslog08
          0 INFO: restart /etc/init.d/syslog
```

The says it passed, but the status is "some facilities failed to work" and the log file says that the test failed %)

I launched Itp on my box but the 01, 02 and 08 syslog tests passed... I have a CentOS 4 setup on this node, maybe this is a SuSE issue? Rishikesh, can you try this on another OS?
