Subject: Network Fails Each Day

Hello,

So far my OpenVZ system is working fine and I have been able to work inside my VEs without any problem. However, I noticed that each day after I wake up in the morning I check my server and notice that the network is not running. I have to issue a "service network restart" every morning while logged into SSH on the HN to kickstart my VEs. After that, everything works fine.

Is there any reason why my network shutdowns each day? The VEs continue to run no problem, it's just that the network stops and nobody can ping or access the VEs via SSH for example. I am checking my logs but can't figure out what is tripping the system.

Has anyone else had this problem where they have to issue "service network restart" frequently?

Thanks!

Jim
