can't recall anything exotic, with the same config and clean 2.6.24  
machine boots OK.

At first I thought that the problem was with 'video=791',  
but after changing this it looks like it restarts right after trying to  
init processor 0. I ain't got rs232 in this machine, and I don't know what  
other way could catch that boot sequence (I think netconsole initializes  
way later)
