Hi,

It's just an assumption
from "man vzctl":

Quote:Memory output parameters

This parameter control output of /proc/meminfo inside a VE

--meminfo none

No /proc/meminfo virtualization (the same as on host system).

--meminfo mode:value

Configure total memory output in a VE. Free memory is evaluated accordingly to the mode being set.

You can use the following modes for mode:

pages:value - sets total memory in pages

privvmpages:value - sets total memory as privvmpages * value
