Instead of messing with `/var/run/network/ifstate`, I've found:

```
ifdown lo
ifup lo
works fine too.
```

Still, I'd like to find a permanent solution as well. I'm wondering if the line:

```
/etc/init.d/networking restart
```

in `/etc/rc.local` has something to do with it. I see that case excludes the 'lo' interface. What about just linking `networking` into the `rcN.d` directory, or using 'start' in `rc.local` instead of `restart`, if the `networking` script has not been run?

(I'm running on a remote VPS, so I'm a bit limited in what messing around I can do with `networking`. If I break it, I can't get back in to change back! Otherwise, it'd try it myself.)
