Hello everyone

I usually use the forum to solve my problems with OpenVZ, but now I really need to solve this problem urgently.

I must enable nfs server from one of virtual hosts. To be more precise must activates a pNFS. It seems that if the nfs server will also run pnfs.

Until now I can mount the exports of hardware node in the virtual hosts and everything seems ok.

I read the short article "NFS server inside VE", but

did not understand how to patch the kernel to enable the VEs to start this service. I need the traditional nfs because the pnfs is an application that runs on a layer above.

Thank you now.

P.S.: Excuse my poor English.
