I think here is the balance for having Virtuozo as commercial featurefull/interface/other features product supporting/paying developers for work. Why Redhat would pay openVZ for it? Debian is the largest and most stable distro. If you have brain and hands - you use Debian - if you lasy and want someone solve your problems - you use Redhat and get their support. Everything in the world in the ballance. BUT - redhat OVZ kernel SRC have mess of thousands of the patches and when I have downloaded it - i can't quickly get any idea in what orderthey should be applied. Debian dos not have this mess (though having it's own tricks). Most things is clear and logical. I'm sure there is the tool or description/or something to apply this RH patches in order - but this is not the way I want spend my time to.
