We want to fine tune a server performance. There are 4 vps running in the server node but load is like 20%

We have given each VPS 10% of node's cpu power, 512mb of guarantee and 1gb of burst.

Shall we increase the 10% CPU power to 100% for all the vps's for better performance? But if we allocate all 4 vps's to 100% there might be chances when one vps will hog all the server resources.

Can anyone suggest us how to fine tune the server node or each vps.conf file.

Is there any thumb rule for fine tuning the node?

Thanks
