Subject: Re: CENTOS 5 TEMPLATE - how to get into the vzpkgls
Posted by maratrus on Wed, 20 Feb 2008 06:12:13 GMT

Hi,

To get yum working for your VPSes you can apply several ways:

1. Install yum inside your VPS like on the common Centos-5 system, i.e. enter to your VPS and install appropriate packages.

2. Install yum inside your VPS from HN using vzyum utility.
vzyum <VPS_ID> install yum
To apply this way you have to install appropriate template metadata package on HN which is usually named as vztmpls-os_name.arch.rpm. I couldn't have found appropriate package on the http://download.openvz.org/ but please look at this page
 http://forum.openvz.org/index.php?t=msg&th=2512&star t=40&
Steve created vztmpl-centos-5-2.0-3.i386.rpm. I think you can get it.
