Quote:... how are people evaluating what size files are going to eventually populate the server ...

Well, they usually set them to something like MAX_HW_INODES/NUMBER_OF_VES and then increase/decrease them depending on the requirements.

Quote:What is the baseline for the initial default inode settings?

These numbers came from testing. We just noticed how much inodes consumes an average web server (with Apache, Sendmail, MySQL, ect) and set them in default config files.
