 It's not quite the maximum anymore, is it? More like the minumum maximum;). A better name might better document what the test is actually trying to do.
 One question I have is whether the unpatched test is still valuable. Based on my limited knowledge of the test I suspect it's still a correct test of message queues. If so, perhaps renaming the old test (so it's not confused with a performance regression) and adding your patched version is best?
Yes, you're completely right.
I'll resend a patch today.
