You should investigate the situation step-by-step.

First, you should go into VE0 and check that you see incoming packets coming from proper interface via
   tcpdump

If you do not see them - check that you see arp requests.

The node will arp reply for 1.2.3.4 if and only if
   ip r g 1.2.3.4 from [your_ip] dev [incoming dev]
will return a route _OTHER_ than one to [incoming dev]

Regards,
   Den
