Excuse my intrusion but I have some question:

1. Quote:/etc/vz/conf/<guest_id>.conf provides the kernel version.

What parameter in conf file provides the kernel version?

2. What is the main goal of your experiment? Do you want to control "uname" output inside VE?

Do you want to install kernel rpm inside VE? Anyway there is only one real running kernel. If you install kernel rpm inside VE you will not be able to boot VE in it. Or I've misunderstood you?
