Hello Marat,

1.
I did not exactly write what I meant: <guest_id>.conf does not provide directly the kernel version, but the record OSTEMPLATE gives the name of the cache and as I am the one who realized it from scratch, I know exactly the kernel version . I can even put it in the name of the cache!

2.
The final goal is to be able to update the guest kernels without too much efforts and down time. So getting the kernel version can be important to know whether a guest has already been updated or not!

I'm not confident yet with the way we can update kernels: Is it possible to update a guest without changing the host? If yes how to do so?

Hope I've been clearer this time.
