yes, this is what happened. It finally got totally troubleshot today

I have a DNS server in a VE; and a rule on the HN that forwards connections on port 53 to the DNS server.

The problem ended up being what you described: various VE would try to make a DNS request and it ended up to the DNS VE.

the answer was to add: -i eth0 in the rule, so only connections coming from eth0 would land to the DNS server, but not the ones originating from inside.

Yesterday, I thought it was fixed because I disabled the rules while I was trying to fix it...
