No, we don't plan on doing that. What we plan on doing is

1. Specify the mount point for each controller

2. In the create group API, specify the name of the group and the various parameters.

If for example CPU is mounted at /cpu and Memory at /mem

Then a specification for creation of group A would be of the form

create\_group(A, cpu=100, memory=100M)

Then,

/cpu/A has shares set to 100 and /mem/A has memory.limit set to 100M

If you want to create subgroups under A, you specify

create\_group(A/B, memory=200M, cpu=50)

That would create /cpu/A/B and /mem/A/B

Please note that memory and CPU hierarchy needs work in the kernel. The shares and hierarchy support is pending. We need to make the res\_counters infrastructure aware of hierarchies.
