Subject: 2.6.18-53.1.6.el5.028stab053.6PAE + ipv6 = not happy
Posted by broquea on Thu, 06 Mar 2008 20:25:44 GMT

So I was running on 2.6.18-53.1.4.el5.028stab053.4PAE up until
2.6.18-53.1.6.el5.028stab053.6PAE had been made available. After switching over, I found that
the HN and the VEs all still had IPv6 configured and running on them, however even with the
default route in place, they couldn't get out. I could ping the gateway, but anything beyond was
"no route to host". I rebooted back into 53.4PAE and everything worked again.

I meant to bring this up earlier after the kernel had been released but have been busy. I'm still
running on 53.4PAE because IPv6 connectivity is a requirement for my system.
