Quote:1) What is the file missing? Because `/etc/vz/conf/abc.conf` really exists and seems to be used to create `/etc/vz/conf/123.conf`!

1. The `--ostemplate` argument telling `vzctl` which distribution to use to create this container. It refers to `/vz/template/cache/abc.tar.gz` file.
2. The missing file in the error message is `/etc/vz/dists/abc.conf` -- a distribution-specific file telling how to tune various settings (such as IP addresses) inside this specific distro. Out-of-the-box `vzctl` supports `fedora`, `redhat`, `suse`, `debian`, `gentoo`, `archlinux`, `altlinux` and some other distros. It does not support a distribution called `abc`, so you should take care of it.
3. File `/etc/vz/conf/abc.conf` is never used.
4. If you want to specify an initial config for a container (with stuff like UBC parameters, disk quota etc.) , this is done with `--config` argument. See `man vzctl` for details.

Hope that helps.
